

HTM64 type TP3 and TP5 with self draining spout

The HTM64 TP3 basin and TP5 high neck pillar taps have been inclusively designed without stigma for use in hospitals, commercial applications, less able or domestic bathrooms. The unique self-draining spout ensures stagnant water, a breeding ground for pseudomonas, does not collect and remain in the spout after use. Functionality and durability has been engineered without compromise for hospital or commercial use environments with brass construction cartridges and ¼ turn ceramic disks. Dimensions fully comply with BSEN200 and the long on/off levers have been designed for easy operation either by hand, elbow or limb.

For complete thermostatic control, the taps should be combined with the TMV2/TMV3 approved Intamix thermostatic mixing valve.
